```
Input:
123
Output:
false
Explanation:
123 is a 3-digit number, and 123! = 1^3 + 2^3 + 3^3 = 36.

Question **3**Correct

Flag question

A number is considered lucky if it contains either 3 or 4 or 3 and 4 both in it. Write a program to print the nth lucky number. Example, 1st lucky number is 3, and 2nd lucky number is 4 and 3rd lucky number is 33 and 4th lucky number is 34 and so on. Note that 13, 40 etc., are not lucky as they have other numbers in it.

The program should accept a number 'n' as input and display the nth lucky number as output.

Sample Input 1:

3

```
Sample Output 1:
33
Explanation:
Here the lucky numbers are 3, 4, 33, 34,, and the 3rd lucky number is 33.
Sample Input 2:
34
Sample Output 2:
33344
```

Answer: (penalty regime: 0 %)

```
1 #include(stdio.h)
2 int main()
3 → {
        int n=1,i=0,nt,co=0,e;
4
        scanf("%d",&e);
5
        while(i<e)
6
7 -
8
            nt=n;
            while(nt!=0)
9
10 -
11
                co=0;
12
                if(nt%10!=3 && nt%10!=4)
13 -
14
                     co=1;
15
                    break;

17
                nt=nt/10;
```
